Project Ideas:

1. Meet Me Halfway™

- a. General Description: When you meet up with friends who do not live nearby, it is most reasonable to meet somewhere near the middle from where you are coming from. This app will help generate locations of entertainment/food for people to meet up and hang out at halfway point or another meeting point based on user preference (i.e. Perry Donham travels 5% and Mike travels 95%). Users can also input their budget to generate results.
- b. Potential APIs: [Yelp Fusion](#), [Yelp Reservations](#), [Google Places](#), [Trip Advisor](#)

2. We Have Food at Home

- a. General Description: Sometimes you are too lazy to go to the store to get food to cook, and you don't have the budget to order in. This app would allow the user to upload a list of ingredients they currently have, and would return a list of recipes they could make. Additionally, it would return recipes that could be completed with 1-3 additional items. Some additional features could be which meals are the most popular, which are most nutritious, and which are the fastest/easiest to make. Users can also filter recipes by diet or cuisine.
- b. Potential APIs: [Recipe and Ingredient Analysis](#), [TheMealDB](#)
